

Final

.3Working Paper: FARM (Food, Alimentation, Resilience, Management) to Table

Committee: World Food Programme

Topic: Instituting policies that support countries in developing appropriate infrastructures to make transporting food efficient and safe and contribute to self-sufficiency,

Sponsors: Austria, Burkina Faso, Finland, Ireland, Mexico, Portugal, Switzerland, Tanzania, Venezuela

Signatories: Kenya, Greece, Mongolia, India, Argentina, Guinea, Australia, Malta, Sweden, Haiti, Ukraine, Guatemala, Czech Republic, Malaysia, Sudan, Bangladesh, Tunisia

The World Food Programme,

Supporting the wide range of regions that are encompassed by countries within the WFP,

Recognizing food insecurity is an issue that scars the globe,

Acknowledging that food transportation consists of $\frac{1}{3}$ of global emissions annually,

Realizing that food overproduction, as well as import overreliance, exacerbates the climate crisis,

Encouraging the engagement of global citizens and organizations in the fight against hunger,

Engagement, Inclusion, Community

1. *Creates* the **MARIACHI (Maximizing Access, Resources, and Inclusion for Agricultural Change and Higher Empowerment)** program for the development and implementation of policies aimed at strengthening rural women and Indigenous peoples' access to critical resources; by addressing these disparities, we can ensure that both traditionally marginalized communities are equipped to combat food security, economic development, and the sustainable agricultural policies in their communities, ultimately improving both their livelihoods and the broader agricultural sector:
 - a. Implement **MARIACHI** policies to ensure rural women and Indigenous people have equal access to financial resources that take into account the specific challenges faced by women and Indigenous people in rural economies, such as limited access to collateral or credit history, financial recourse including:
 - i. Loans will ensure that they have the necessary funds to begin businesses and allow for long-term change as women and Indigenous people will be financially independent and be able to create change by themselves,
 - ii. Investment opportunities to finance Indigenous people and women's entrepreneurship and ideas to ensure that they come into fruition,
 - b. Establishing sensitive policies is essential to ensure that women and Indigenous people have equal rights to land ownership and land inheritance, as securing land tenure increases women and Indigenous people's decision-making power, economic independence, and food security within their households and

communities, leading to social stability and economic growth; these policies should remove barriers to land ownership that limit both women and Indigenous peoples rights to land in rural settings, such as;

- c. Discriminatory inheritance laws which prohibit women from inheriting funds and creating generational wealth and investment;
 - i. Land tenure systems ensure that women have access to the land necessary for long-term resilience,
 - ii. Cultural norms because the societal perception of women and Indigenous people affect the way they may pursue food security,
 - d. Providing sensitive agricultural education and training programs to equip rural women and Indigenous people with the skills and knowledge needed to improve their agricultural productivity; these programs should cover topics such as;
 - i. Sustainable farming practices to ensure that land is not being misused or contributing to the climate crisis,
 - ii. Climate-resilient agriculture to make sure that crops are made to withstand more extreme temperatures and weather conditions,
 - iii. Post-harvest processing to ensure that women not only have more efficient farming techniques but also have the resources they need after their crops have been harvested,
 - iv. Digital literacy ensures that rural women can engage with modern agricultural tools in a digital society in order to engage with modern agricultural tools and markets so nobody gets left behind,
 - e. Educational initiatives will be rolled out in rural communities across the globe, particularly where women are often excluded from formal agricultural education programs and should be prioritized in remote areas where access to formal education is limited in this way, while;
 - i. Recognizing the nuanced differences between rural, suburban, and urban areas in terms of the relative involvement of women and cultural/geographic factors,
2. *Establishes the **Women Empowerment Design for Greater Education (WEDGE)** Potato Program to encourage FARM TO TABLE and rural-to-urban partnerships between women and Indigenous owned farms by;*
- a. Using the **FRIED** database to map which areas of the country are the most industrialized and have the highest propensity for tourism,
 - b. After identifying tourism-dense areas, restaurants in those dense areas have the option to opt into **WEDGE** which would partner them with a woman-owned or indigenous-owned farm based domestically,
 - c. Restaurants will levy a tax in accordance with VAT tax rates standard to each country that they can apply to items in their restaurants in high tourism areas,

- d. The profits from the tax levied should be split between the women/Indigenous farm and the urban restaurant owner to better encourage rural/urban partnerships and keep food sourced domestically,
 - e. Restaurants and high-volume tourist attractions to buy from women, Indigenous, and minority-owned farms;
 - i. Such restaurants and attractions will receive enhanced promotional opportunities in partnership with their local governments,
 - ii. A price limit will be set on dishes made with goods specifically from the aforementioned farms,
 - f. Would establish a produce prescription program that coordinates urban areas to access rural food markets such as farmers' markets by;
 - i. Providing food/produce prescriptions to lower-income communities in urban areas,
 - 1. These prescriptions would be redeemable for fresh produce produced in rural areas and would keep food domestic
 - 2. These prescriptions would be subsidized by each country's health and agriculture departments
 - ii. Promoting healthy food education through access to doctor visits to ensure malnutrition and stunting aren't common in children
3. *Establishes* a Food Refugee Status to be claimed by the 90 million displaced by food insecurity annually;
- a. Refugees facing chronic food insecurity will claim this status and be connected through farmers identified in the **SCALLOPED** program,
 - i. Modeled after the relationship between Irish farmers and Syrian refugees, in which,
 - ii. Local farmers offer food and housing to Food Refugees indefinitely, supported by the WAFFLE fund
 - 1. Food Refugees will have the option to work on local farms, conducting tillage and transportation operations,
4. *Creates* the **LION (Listening and Integrating for Optimized Networks)** initiative;
- a. Creates a forum where farmers from Indigenous communities & rural communities can share tactics to mitigate challenges with transportation,
 - i. An emphasis would be placed upon farmers of marginalized identities (women, low-income)
 - ii. Farmers would receive a stipend for any time lost
 - b. Farmers can be connected to businesses that require locally sourced food,
5. *Educate* those in rural areas to achieve long-term impacts with the program, **SPARK (Supporting Progress and Resourceful Knowledge)**; educating the willing population to learn valuable skills to be able to contribute to the production, allocation, and

deliveries of food; this program will be as swift as possible taking up to a year to complete;

- a. Volunteers who achieved a teaching certificate that is validated by UNITAR will be used to provide the education and skill,
- b. The education will consist of multiple “courses” in order to ensure maximizing sustainable food production,
 - i. Edaphology, teaching the study of soil in relation to how it’s used, Helping individuals identify the best soil for growing crops,
 - ii. Sustainable farming implemented by farming techniques that maximize growth with limited resources,
 - iii. Climate change adaptation, which would educate farmers on how to adjust practices in response to changing environmental conditions,
 - iv. Crop rotation which can be beneficial in maintaining soil health and increasing long-term productivity,
 - v. The transportation of goods; teaching when crops should be prepared for transportation to minimize exposure to heat, cold, and other harmful conditions,
- c. **SPARK** will prioritize the education of women while advocating for their worker rights ensuring that they have a positive impact on the food economy,
- d. Creation of a skill-sharing space utilizing **FAJITA** for farmers to connect with one another and build a better rapport in the community in order to diversify their knowledge;

Food Production/Distribution/Transportation

6. *Creating **FAJITA** (Food Access, Joint Initiatives, Technology, and Agriculture)* forums for rural people to build bonds between communities to strengthen social and economic bonds and help build resilience in bringing together suppliers and buyers of produce in a community to ensure that everyone’s voice is heard and everyone’s needs are communicated,
 - a. Developing and scaling community-based food distribution systems that will focus on creating sustainable, efficient, and equitable food supply chains that are tailored to meet the needs of local communities,
 - b. Creating forums that will determine and reinforce local norms and solutions, so that any long-term solutions can be created that promote resilience in the future that will last and create self-sufficiency,
 - i. Such that communities are able to develop and implement solutions that are uniquely tailored to their own circumstances
 - ii. Allowing communities to build independence in achieving their own sustainable goals through partnering, not parenting

- c. The **FAJITA** system will establish shorter supply chains, ensuring that food reaches communities faster, reduces waste, and ensures freshness while integrating volunteer and cooperative-based models to increase local participation and ownership,
 - i. Shorter supply chains are defined as localized networks designed to facilitate the efficient delivery of food from producers (local farmers) to consumers (households, markets, community food hubs, etc)
 - d. Advocates for governments, community-based organizations, NGOs, and small-scale farmers to collaborate in order to create food hubs and distribution networks that are closely integrated into local economies,
 - i. These systems will leverage digital platforms for real-time tracking of supply and demand, mobile apps to facilitate communication between producers and consumers and crowd-sourced information about food availability,
 - ii. Financial and logistical support will be provided by international donors and the private sector to build infrastructure (community markets, transportation networks, etc.),
 - e. Strengthening local food producers through training programs and technical support to ensure that these community-based systems are sustainable; local communities will be engaged in the decision-making process and the management of the food distribution system to foster a sense of ownership and responsibility,
 - i. Farmers and producers will receive training in sustainable farming practices such as:
 - 1. Post-harvest processing to ensure that farmers have improved farming techniques
 - 2. Ensuring farmers have the resources and ability to get their crops to market
 - ii. Working with communities to develop efficient distribution methods based on local practices to ensure that after farmers harvest their crops, they are distributed in a way that will maximize the retention and survivability of food being transported
 - f. Helping to prevent worker exploitation by platforming all stakeholders in agricultural endeavors
 - g. The **FAJITA** forums will leverage community involvement to empower local communities to take control of their food supply systems, contributing to long-term resilience in food security by reinforcing social and commercial ties within a community
7. *Suggests* countries adopt the **Farms Reducing Impacts of Environmental Damage FRIED** Potato Program which urges federal governments to work with their local governments to establish a moratorium on new and expanding concentrated animal

feeding operations and to work with large-scale industrial farmers to retroactively apply the moratorium until the following action steps are taken;

- a. Concentrated animal feeding operations are required to report manure byproducts in tonnes as hazardous waste under any hazardous waste and sewage legislation
- b. The federal government should create a national clean air standard to apply to concentrated animal feeding operations to create better mechanisms to monitor air emissions and collect air emissions data to better understand the risks posed by exposure to concentrated animal feeding operations and their waste,
- c. Federal governments in conjunction with local governments should prohibit the use of liquid manure handling systems including waste lagoons and fertilizer fountains to reduce public health risks posed by groundwater exposure and the spray of passing transports
- d. The federal government should create a Discharge Pollution Strategy to monitor and qualify the amount of fertilizer each operation can use in accordance with;
 - i. Soil nutrient density as recorded in the **SCALLOPED** survey
 - ii. Nationally agreed upon agroeconomic standards
- e. The federal government should create zoning laws that require each farm to undergo rigorous inspections before permitting is established
 - i. Zoning laws should reorient farmland especially farmland with agricultural production capacities away from the residency locations of historically underrepresented and marginalized communities
 - ii. Inspections need to be passed before a permit can be issued and include;
 1. Environmental impact assessment
 2. Health impact assessment
 3. Food mileage impact assessment
 4. Zoning compliance assessment
- f. The federal government should eliminate any current exemptions under health and safety and labor laws as they pertain to concentrated animal feeding operations that require them to:
 - i. Establish a minimum wage without residency requirements for all agricultural workers in the country
 - ii. Document the number of agricultural workers in each operation and ensure they have enough space to safely perform their duties
- g. In compliance with the 2017 recommendations set forth by the World Health Organization, concentrated animal feeding operations should stop the use of medically important antibiotics in healthy animals to reduce the possibility of initial threads of disease to later affect future transport
- h. The federal government should eliminate any waste management subsidies concentrated animal feeding operations may receive

8. *Endorses* the Food Mileage Program, intended to revolutionize the way food is transported and consumed, recognizing
 - a. Utilizing data from **SCALLOPED** and **FRIED** to keep track of CO2 emissions that occur throughout the food production process
 - b. Encouraging the exchange of knowledge between different food productions,
 - c. Measuring carbon usage through units between 1-10
 - i. An FMU (Food Mileage Unit) over 5 will be taxed a flat rate of 0.3% in food retailers,
 - ii. To be contributed to the **WAFFLE** Fund and distributed to farmers local to each retailer's area,
 1. "Local" is defined as within 75 km,
9. *Authorizes* the **LEOPARD (Logistics Enhancing Operations for Pest Attack Risk Deterrence)** initiative, to provide solutions for pests attacked shipments of food materials
 - a. Promotes the use of alternatives to traditional pesticides,
 - i. Essential oil pesticides non-toxic fumigants would be promoted
 - ii. All recommended alternatives would be tested to see effectiveness and safety in enclosed environments and near human beings
 - b. Provides training to farmers who use **PUMA** to help ship their products
 - i. Provided with sources to obtain sustainably sourced packaging materials
 - ii. Given instruction on proper disposal of any products used to transport/make food materials
 - c. Allows accessibility of the **PUMA** database for farmers to see paths and regions that are affected by pests
10. *Recommends* the creation of the **CHEETAH (Cold storage Hubs for Efficient and Expedited Transportation And Handling)** which implements specific technologies to ensure food preservation of perishable goods in their transportation:
 - a. Creating cold chain storage facilities in Member States to ensure the safe transportation of perishable goods, such as expanding cold storage and refrigeration facilities powered by:
 - i. Solar Panels
 - ii. Biogas Generators
 - iii. Fissile-powered small modular reactors
 - b. Implementing standardize temperature during the transportation of food to improve the durability of the goods that are transported by creating temperature and humidity control on a regular basis to ensure that the standardized norms are followed, the control will be founded by voluntary donations of Member States;
 - c. Ensuring the tracking of food transportation for better logistic and resource efficiency with:
 - i. Satellite surveillance
 - ii. Drones

- iii. Chip implementation
- d. Technologies would be sourced from existing companies, such as Keep It Cool, by forming public-private partnerships;
- e. Regions with high need would be identified in accordance with WFP records and heat records, in conjunction with the agricultural audit,

Infrastructure (Technology, Energy) + Data & Information

11. *Establishes* the Survey and Census of Agricultural Land Lasting Operations

Pertaining to Economic Decision Making (SCALLOPED) Potato Program which works in conjunction with the FRIED Potato Program each country is improving self-sufficiency through a survey of existing lands and recommendations for their usage:

- a. Calls upon the agricultural department of each nation alongside public and private researchers to conduct a survey of lands in each country to:
 - i. Understand their historic role in agricultural production;
 - ii. Categorize their soil and nutrient densities;
 - iii. Categorize their soil and nutrient absorption;
 - iv. Identify water resources that drain into and interact with lands;
 - v. Identify the caloric output per ton for each crop;
 - vi. Identify the protein output per ton for each crop;
 - vii. Identify the tillage cycles for each crop;
 - viii. Identify the susceptibility to disease each crop undertakes;
- b. **SCALLOPED** Potato Program in conjunction with **CHART** will create a living atlas layered kinetic map through ArcGIS technologies to establish a tiered system for identifying the best crops to plant for times of year and for the area of land:
 - i. Tier One will map historically tilled land and land currently used for tillage today:
 - 1. This will indicate the placement of silage and hay;
 - 2. This will be the primary land indicated for the most protein-producing and caloric-dense crops;
 - ii. Tier Two will map pasture and rough grazing land:
 - 1. This will indicate land used for animal agriculture operations;
 - 2. Due to its historic role as untilled and rarely tilled this land will shift to tillage land due to the moratorium outlined in **FRIED**;
 - iii. Tier Three will map nonagricultural land such as forestry, scrub, peatlands, wetlands, mountain ranges, and built-on land:
 - 1. This land is primarily used for agricultural feedstock crops;
 - 2. Much of the forestry, scrub, peatlands, and wetlands offer good resources to support animal livelihoods rather than traditional pastures and grazing lands;

- c. After identifying the tiers of land and the crops best suited for increasing self-sufficiency each country should model the following through an environmental impact assessment:
 - i. A Business As Usual (BAU) framework in which agriculture continues on its current trajectory;
 - ii. A Business As Usual and Export Substitution (BAU ES) framework in which countries engage in export substitution and reduce import dependency;
 - iii. A Business As Usual and Robust Substitution (BAU RS) framework wherein Robust Substitution Products intended for export are used instead to replace broadly similar but not identical products:
 1. For each farmer to ensure their farm contributes to the framework, agricultural subsidies previously going to industrialized agriculture should go to the **SCALLOPED** Potato Program instead;
12. *Creating the **AZTEC (AI for Zeroing-in on Transportation, Ecosystem, and Crop-optimization)** algorithm to identify points of improvement and areas of greatest need of revived food infrastructure and road system improvements to optimize resource allocation at every level in addressing logistical barriers, strengthening food security systems, and promote cross-border cooperation between governments, international organizations, and the private sector;*
- a. **AZTEC** will use real-time data to identify regions that are most vulnerable to food insecurity while assessing the capacity of existing infrastructure to meet local demand and prioritize areas needing improvement or revival to enable targeted investments that strengthen food systems
 - i. Real-time data can include weather patterns, crop yields, socio-economic indicators, and transportation infrastructure
 - ii. Existing infrastructure can include food storage facilities, markets, and transportation routes
 - b. **AZTEC** will identify and categorize road infrastructure needs in relation to food security by assessing the current state of road systems, categorizing roads based on their repair needs and highlighting regions with insufficient road access to facilitate the transportation of food, highlighting regions with insufficient road access to facilitate the transportation of food
 - i. Prioritizing areas where roads are most critical to improving food distribution, with categories of RED, YELLOW, and GREEN:
 1. RED corresponds to areas in critical need of road repairs or areas without sufficient road systems,
 2. YELLOW corresponding to areas in need of road repairs,
 3. GREEN corresponds to areas in need of minimal road repairs,

- c. Maintains that the **AZTEC** will help governments and organizations prioritize infrastructure projects by identifying and categorizing areas in need to ensure that food security needs are met in the most efficient manner, such as:
 - i. Expanding road networks to ensure food may be transported in the most efficient manner;
 - ii. Expanding programs to modernize warehouses to make sure that food can be stored in places where it will last longer so that people will have more access to food
 - iii. Creating sustainable transportation systems that can withstand climate change impacts to account for the effects of climate change and ensuring that new systems can withstand future effects
13. *Creates* the **Corn Residual Energy Activation Mechanism (CREAM)** of Potato Program which calls on countries who have completed the agricultural survey outlined in **SCALLOPED** to:
- a. Reorient their crop yield towards energy production by planting corn for the creation of cellulosic biofuels from the remaining excrements of the corn;
 - b. If a country produces its own corn or if it receives whole corn through foreign food aid programs, countries should:
 - i. Collect the corn byproducts such as stalks and husks and sugar bagasse;
 - ii. Establish centers through private-public partnerships or with government clear energy grants to ferment the corn stover through yeast depolymerization;
 - iii. The energy required for enzyme conversion and depolymerization should be sourced from the converted biomass in **CHEETAH** facilities as is standard for agricultural cellulosic ethanol production;
 - iv. Redirect current conflict areas, especially natural-resource conflicted areas to create joint venture agreements that:
 - 1. Encourage nations to plant more corn, sugar, and stable agricultural crops domestically to better increase food protection and security in affected areas;
 - 2. Encourage nations not to target food and corn crops in times of armed crisis else an energy embargo be placed on them;
14. *In states* the global strategy system **Moving Agriculture Properly (MAP)** to operate under the World Food Programme as a new initiative to develop stronger connections and infrastructure to transport food safely and efficiently;
- a. An international body that operates under the World Food Programme receives geographic and regional information from the World Meteorological Organization (WMO) and receives oversight and guidance from the GIS organization International Peace Information System (IPIS)

- b. **MAP** will develop the transportation maps in **CHART** for the regional planning bodies and other potential UN agencies to use to transport critical supplies including but not limited to:
 - i. Food
 - ii. Water
 - iii. Supplies
 - c. Surveillance maps will be distributed to trusted third parties
 - i. Trusted third parties will be vetted by **MAP** to ensure the intelligence distributed will be used in a safe and equitable manner
 - d. The body will comprise geographical experts recommended by the WMO and member states voluntarily
 - e. Member states must be a signatories to the body in order to have access to the mapping technology **MAP** produces
15. *Develops the Countering Hunger and Applying Place-based Technology (CHART)*
 Plan to develop complex regional and international plans that focus on the future of infrastructure development using GIS Technology
- a. GIS technology will be used to map out conflict zones, current trade and agriculture transportation routes, food production and farming routes, current international food program implementation areas, and high-density populated rural areas
 - b. These maps will receive input from stakeholders international organizations, and regional organizations such as
 - i. International organization: WFP, ICRC, WHO, UNICEF, UNHCR
 - ii. Regional organizations: local government, Indigenous populations, farming communities
 - c. The **Moving Agriculture Properly (MAP)** organization will receive this stakeholder input and input it into the GIS technology system to develop these complex mapping systems,
 - i. With the production of these mapping systems, they will be distributed to the following bodies through secure-encrypted channels to ensure that security-related threats to food are not going to threaten these transport routes
 - ii. Information will be shared only with safe and approved stakeholders, and those organizations can use this information to consult communities on the current safest routes for food transportation
 - d. In the long term, these complex maps can be layered for targeted urban planning for food and agricultural transportation as well as export-focused agricultural production development;
 - i. Working in accordance with **MAP** and **FRIED** to communicate the findings to national governments and bodies to communicate further land

development, and finding the most efficient systems that will be implementable, proven safe, and sustainable,

16. *Promotes* the uptake of the **Geographical Regional Action-oriented plan for Holistic Food Systems program (GRAPH)** to help build sustainable regional rural food systems that emphasize and develop self-sustainable food ecosystems, and prepare rural communities for potential threats to food security

- a. The goal of this program is that it will work with the WFP, UNHCR, and State governments to develop regional food communities that will work on protecting local food sovereignty and sustainable community food systems
- b. GIS-related information and **MAP** body to categorize the areas needed, and then areas will work with regional and state government and international organizations to assess the priority based on the current factors;
 - i. Communities and their access to food storage facilities
 - ii. Distance from urban areas,
 - iii. Drastic changes in population due to displacement crisis,
 - iv. Access to water,
 - v. Acute food insecurity,
 - vi. WHO indicators for malnutrition such as stunting, wasting, and underweight are considered high for the population

17. *Advocates* for the uptake of the food security systems plan using the **Ecological Agricultural hubs for a Sustainable Terra (EAST)** implementation plan, these Hubs will ensure and focus on

- a. Ensuring communities have what they need as often rural communities are focused on exporting their agricultural goods to generate income to buy other necessary foods to feed their families, the **EAST** program would work to develop community cooperative gardens to produce food that stays within local communities to ensure their needs are met first
- b. Seed-sharing processes to ensure sustainable continuous agricultural production and the elimination of the need for genetically modified seeds, that do not allow for continued agricultural production and seed collection
- c. Educational facilities will be located by **EAST** facilities to allow for mothers and families to commute together and allow more children to access schooling and receive lunches that will be produced through school lunch programs
- d. Utilizing the **CHEETAH** program to build and ensure the long-term maintenance and preservation of cold storage facilities for community usage
- e. Constructing Water and Sanitation areas within these hubs will work to ensure
 - i. Access to potable drinking water through groundwater pumps
 - ii. Sanitation facilities such as hand washing stations and toilets, which will have run-offs into wastewater ponds, which will utilize sediment and biodiversity filtration, providing safe water for community farming

- f. Developing educational programming for women and children that provides education on traditional and Indigenous farming techniques from the regional areas to help foster food production that is sustainable and suited for that geographical environment,
18. *Emphasizes* the importance of information with the establishment of the **PUMA** database
- a. This database will be managed by the World Food Programme to ensure the reliability of the information
 - b. This database will monitor the status of roads, railroads, and maritime routes;
 - c. This database will be paired with the AI algorithm
 - i. The algorithm will interpret the data within the database to create assessments
 - d. The database will work in conjunction with the **FRIED** potato program to ensure that while infrastructure is being built there is still an adequate amount of land for agricultural purposes
19. *Establishes* the **GRATIN** (Global Reactor-Assisted Transport for International Nutrition) Potato Program,
- a. Recognizing that 1/3rd of global emissions is created by food transportation, this program will
 - i. Offer a subsidy program to nations with food cargo ships in order to reduce the size of their fleet in exchange for nuclear-propelled vessels,
 - ii. Such vessels will utilize a pressurized water reactor design with both a primary and secondary system or a Small Modular Reactor,
20. *Introduces* the **Modular Alpine-Inspired Logistics Hub (MALH)**, a network of decentralized, adaptive food storage and distribution centers that are;
- a. Created with a modular architecture, meaning they can be scaled up or down based on regional demand and moved as needed
 - i. Inspired by highly efficient alpine storage
 - ii. Prefabricated from lightweight sustainable materials such as recycled laminated timber,
 - iii. Includes solar-powered refrigeration, to ensure food preservation and restrict food wastage,
 - iv. Features Artificial intelligence-powered inventory systems,
 - b. Designed to be implemented in remote, rural, and disaster-prone areas
 - i. Used for optimizing space, food storage, speed of deployment, and sustainability
 - ii. Implemented in any region, regardless of road infrastructure quality;
 - c. Reduces food waste by ensuring climate-controlled storage near farms and rural areas;
 - d. Enhances disaster resilience by allowing food storage hubs to be moved or expanded based on need;

- e. Minimizes transportation costs and emissions by decentralizing food supply chains;
21. *Establishes* the **MEERKAT** (Mitigating Environmental change with Knowledge Application)
- a. Establishes a safety net program for transportation routes affected by climate change events or catastrophes:
 - i. Events can be, but not limited to, fires, drought, floods, earthquakes
 - ii. Common routes would be identified using the **PUMA** database
 - b. Food producers would be provided with the resources necessary to fill in the gaps caused by environmental changes
 - c. Program funded on voluntary contribution of Member States to the **WAFFLE** fund
22. *Invites* Member States to voluntarily contribute to the **WAFFLE** Fund that will finance different initiatives such as **MARIACHI, SCALLOPED, AZTEC, FAJITA, CREAM, MALH, FRIED, CHEETAH, MEERKAT**
23. *Calls upon* the funding of all aforementioned programs, through **Wealth Economic Success Trust (WEST) and the WAFFLE Fund**, a combined effort from the UNHCR, UNICEF, and WHO along with any voluntary member states as these initiatives are committed to supporting programs that address the betterment of society
- a. The interdisciplinary programs outlined above widely address food insecurity and circumnavigate problems that developing countries face in infrastructural development
 - b. An educational internship program will be established to help fund **WEST**
 - i. Geographical and Health Studies students can intern at **MAP** and payment for their internship will be siphoned to **WEST**; this will complement funding received from other UN organizations
 - c. The **WAFFLE** fund will be founded by signatories member states where they will contribute between 0.1 to 1.0% of their Gross Domestic Product (GDP) annually, accounting for fluctuation inability to donate, and
 - i. Will support local farmers in their ability to house and feed Food Refugees
24. *Urges* for the creation of **Securing Overall Unification Through Help (SOUTH)** this program will oversee global affairs agencies that opt into projects overseen by **MAP**
- a. IGOs, NGOs, and other charities that will benefit from **MAP** programs will pay a fee to help fund and promote **GRAPH's** worth
 - b. **SOUTH** will fund programs **CHART, MAP, GRAPH, EAST**, and all related programs in combination with **WEST**
25. *Decides* to remain actively seized in the matter;
